

ADDIE in Practice

Retrospective Mapping of a 10-Week Learning Programme

Instructional design · Needs analysis · Programme development · Delivery · Evaluation

Adapted retrospectively from original programme-design work completed as part of the Cambridge DELTA diploma.

ADDIE at a glance

ANALYSE	DESIGN	DEVELOP	IMPLEMENT	EVALUATE
What do learners need?	What should they achieve?	What will support learning?	How will learning happen?	What shows progress?

Purpose of this mapping

The original programme was designed from learner evidence rather than from an ADDIE template. This portfolio artefact maps the documented process retrospectively against ADDIE to show how the work aligns with a recognised instructional-design model. The mapping focuses on decisions that can be evidenced from the original needs analysis, diagnostic testing, course proposal and lesson plan.

Programme evidence base

AUDIENCE	DURATION	DIAGNOSTIC BASELINE	COURSE FOCUS
10 learners aged 16-17	10 x 2-hour sessions	43.6% class average	FCE Use of English

What the framework reveals

- The learning need was identified before the programme content was finalised.
- Objectives, activities and assessment were connected to evidence from the learner group.
- Development combined selected published resources with self-made and learner-generated materials.
- Evaluation was embedded throughout the programme rather than left until the final session.

The programme mapped to ADDIE

Each stage below is grounded in documented decisions from the original programme-design work.

1 ANALYSE

What did the learners need?

A self-made needs-analysis questionnaire was combined with previous examination results, former-teacher comments, personal observations and a diagnostic test. The baseline class average was 43.6%; Part 1 averaged 61%, while Parts 2-4 were around 38-39%.

Design value: Priorities were based on multiple sources of learner evidence rather than assumption.

2 DESIGN

What should the programme achieve?

The programme defined learner-training and language objectives around exam format, language in context, prediction, logical discrimination, staged task technique, tenses, word forms, collocations and prepositions. A cyclical syllabus revisited key skills across the ten weeks.

Design value: Objectives and sequence were aligned to the needs and diagnostic findings.

3 DEVELOP

What materials and activities would support the objectives?

The course blended course-book content, examination-preparation material, past exam tasks and self-made resources. Activities included strategy summaries, staged practice, games, discussions, tests and learner-generated materials.

Design value: Materials were selected for usefulness, variety, motivation and relevance to target performance.

4 IMPLEMENT

How was the learning delivered?

Ten weekly two-hour sessions ran alongside the learners' normal course. Delivery mixed individual, pair, group and whole-class work, timed practice, peer and teacher feedback, and communicative examination tasks.

Design value: Implementation balanced examination accuracy with active participation and communication.

5 EVALUATE

What evidence was used to judge progress?

Evaluation was continuous: homework and practice checks, marked timed tasks, peer checking, a full practice test in Lesson 9, and final feedback and learner reflection in Lesson 10.

Design value: Assessment and feedback informed learning throughout and supported a final review of progress.

From evidence to learning design

The ADDIE mapping also makes the alignment between identified need, design response and evaluation visible.

EVIDENCE / NEED	DESIGN RESPONSE	EVALUATION / FEEDBACK
Diagnostic weakness in Parts 2-4	Prioritise task technique, word forms, prepositions, transformations and staged strategy practice.	Formative practice, timed tasks, marking and full practice test.
Learners wanted grammar improvement without losing speaking practice	Build communicative activities around examination content and language targets.	Pair/group practice, peer checking, discussion and learner-generated tasks.
Learners preferred varied interaction and examples	Use a mix of individual, pair, group and whole-class work with varied materials.	Ongoing observation, checking and feedback across different activity types.
Task understanding and concentration affected performance	Teach rubrics, task staging, prediction and logical discrimination explicitly.	Repeated strategy review followed by exam-style application and feedback.

What this demonstrates

Learning needs analysis	Activity and materials development
Evidence-based programme design	Facilitated learning delivery
Objective and syllabus alignment	Assessment and evaluation

Retrospective reflection

The original DELTA project was not labelled as an ADDIE project. Mapping it retrospectively shows that the documented design process followed a comparable logic: evidence informed objectives, objectives shaped content and activities, the programme was delivered through a planned learning pathway, and learner progress was checked throughout.

EVALUATION BOUNDARY

The original evidence supports evaluation of learning during the programme. It does not document longer-term transfer after the course or wider organisational impact. Those outcomes should therefore not be inferred from this artefact.

Evidence base: original Cambridge DELTA extended assignment, Teaching Examination Classes: Preparing Students for the FCE Use of English Test, and the associated 10-week FCE Use of English Course Plan.
